SUMMARY

Backend Engineer with **3+ years** of experience building **reliable, scalable**, production-grade systems. Strong at taking **ownership** of complex problems, **debugging** difficult issues, **learning** new technologies **quickly**, and staying **calm** under delivery pressure. Uses **AI-assisted** development to improve engineering **efficiency**, write **clean, maintainable code**, and drive work to completion with **consistency** and **accountability**.

SKILLS

- **Languages:** Java, Go, Python, C++, SQL
- **Backend & Architecture:** Microservices, Distributed Systems, REST APIs, Dropwizard, Event-Driven Architecture
- **Cloud & Infrastructure:** Oracle Cloud Infrastructure (OCI), Docker, Terraform, Linux
- **Databases:** MySQL
- **Testing & Developer Tools:** TestNG, Mockito, JaCoCo, Maven, Git, Jira, Grafana

EXPERIENCE

Oracle <i>Member of Technical Staff</i>	<i>July 2023 - Present</i> Bangalore
• Supported and enhanced the Uploads service of OCI Log Analytics by owning backend ingestion workflows across production regions, strengthening upload resiliency for high-volume customer telemetry pipelines. • Built an open-source OpenTelemetry Collector logs exporter for OCI Log Analytics (GitHub) with authentication, queue/retry controls, gzip uploads, and payload chunking, validating throughput of up to 80,000 logs/second on 1 CPU. • Redesigned Object Store Collection workflows to ingest 10+ TB of Object Storage data per region, expanding pipeline capacity for large-scale storage collection. • Hardened ingestion paths with validation, retry, and fault-tolerance controls, increasing automated test coverage to 90%+ with TestNG, Mockito, and JaCoCo. • Delivered multi-realm production releases and remediated 50+ CVEs/security findings across 131 OCI production regions and 40 realms, reducing security exposure while maintaining rollout consistency.	
Oracle <i>Project Intern</i>	<i>May 2022 - July 2022</i> Remote
• Developed Kafka-based lifecycle notifications in Java for configuration-object CRUD events across sources, parsers, fields, labels, lookups, and ingest-time rules, enabling near real-time cache refresh and consistent config propagation across downstream microservices. • Reduced config cache propagation delay from 15 minutes to real-time updates by implementing Kafka-driven event flows that invalidated stale caches in dependent services such as Log Processor, Query, Uploads and Config.	

PROJECTS

ECG-Based Heart Disease Classification <i>Python, CNN, ResNet-50, Transfer Learning, CWT, Signal Processing</i>	<i>2022</i> IIT Roorkee
• Designed a balanced 3-class ECG classifier from PhysioNet MIT-BIH Arrhythmia, MIT-BIH Normal Sinus Rhythm, and BIDMC CHF datasets, normalizing 30 recordings per class. • Preprocessed 65,536-sample recordings into 500-sample windows, expanding 90 source signals into 900 segments with a 750/150 train-test split. • Converted ECG windows into 224x224 RGB CWT scalograms using Analytic Morlet wavelets and 12 voices per octave, then adapted ResNet-50 final layers for ARR/NSR/CHF transfer learning. • Achieved 95.33% test accuracy after 8 epochs and 296 iterations, with 143/150 correct predictions and confusion-matrix-based error analysis.	

EDUCATION

Indian Institute of Technology, Roorkee B.Tech. in Electrical Engineering CGPA: 8.387	<i>2019 – 2023</i> Roorkee, India
Bhagat Public School, Kota (CBSE) Senior Secondary 91.40%	<i>2019</i> Kota, India

AWARDS

Oracle Spot Award , Recognized for Object Store Collection workflow redesign	<i>2024</i>
Secured All India Rank 4024 , JEE Advanced	<i>2019</i>
